

Dear Doctor Mao:

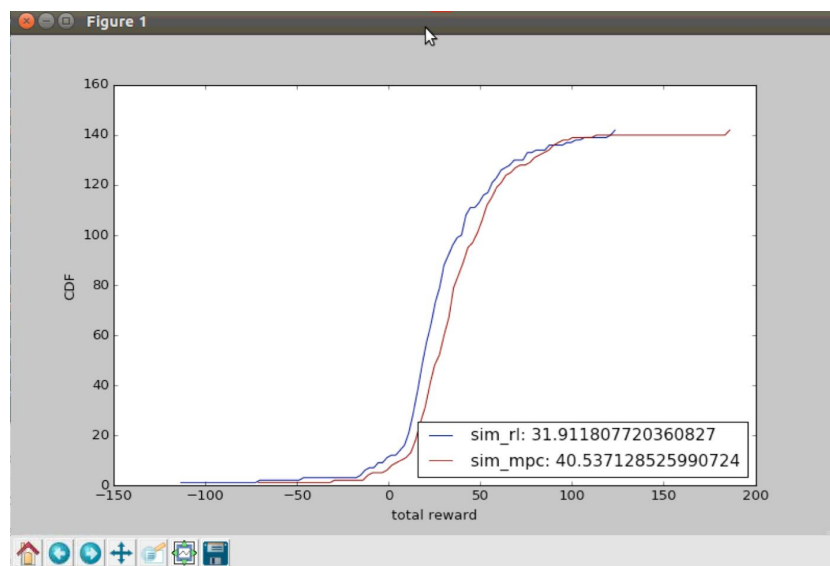

I am a student from UCAS , my name is liuzhilei . Recently I have read you paper about Pensieve . It's really wonderfully so that I want to replay the experiment。 I downloaded the project from your github .

From last Tuesday , I have been training the model using the sample training / testing data you used . But it's still not stopping . It's approximately a week。 I **wonder whether it will stop automaticly** . Here are the tensorboard visions.

I have tested some models trained , but they performed not as good as the `pretrain_linear_reward.ckpt` that you provided , even not as good as mpc.

Is this caused by that I have not trained enough or the model is overfitting because you mentioned in the paper that the training time only need about 4 hours.

I'd very appreciate it if you can answer my questions.

Best wishes to you

liuzhilei@iie.ac.cn
